Angular Dependency■Injection Cheat■Sheet (Standalone ≥ v17 vs Classic NgModule)

Missing provider error	Standalone fix (Angular 17+)	Classic NgModule fix (≤ v16))
HttpClient	provideHttpClient() in ApplicationCc	onfig.providers import HttpClientModule i	in App
Router services / direct	tives provideRouter(routes) in Appl	licationConfig.providers RouterModule.forF	Root(r
Template ■ driven Form	s provideForms()	import FormsModule	
Reactive Forms	provideReactiveForms()	import ReactiveFormsModule	
Common directives / pi	pes import NgIf, AsyncPipe, p	per component BrowserModule alre	eady
Third■party library mod	dule import LibraryModule in the s	standalone component import LibraryMc	odule
Feature ■ scoped service	ce providers: [FeatureService]	l in component providers: [FeatureS	Servic

Rules of thumb

- 1. Standalone: global providers in ApplicationConfig; local providers/imports per component.
- 2. Classic: register once in an NgModule.
- 3. Hybrid mixing is fine.
- 4. Standalone provider functions are tree

 shake friendly.

CLI

- Standalone skeleton: ng new my-app
- Classic skeleton: ng new legacy-app --no-standalone
